

Day 3 - Angular Project Planning: Forms & Authentication Flow

- Design the structure of Login, Signup, and Forgot Password forms with field names, types, and validation rules.
- Create a table or bullet list of form validations and user-friendly error messages.
- Map the full user flow for login, signup, and forgot password (success and failure paths).
- Document backend interaction points for login/signup/reset using Firebase or Supabase.
- Decide how user sessions are handled (token, localStorage) and how logout should work.
- List UI states for each form: default, loading, success, and error.
- Organize all this information in docs only - do not implement code at this stage.
